

# Micro Focus Robotic Process Automation: Ignite Enterprise Productivity

Business users spend too much time on mundane, repetitive, error-prone tasks. Micro Focus® Robotic Process Automation (RPA) introduces a new way of doing things—giving you the power to build, secure, and scale automated business processes, from legacy to modern, across the enterprise. Welcome your new robo workers, liberate human brainpower, and ignite enterprise productivity.

## Micro Focus RPA at a Glance:

- **Easy-to-use design studio:**  
Design and edit automations with ease.
- **Resilient robots:**  
Keep processes flowing when change happens.
- **Centralized robot orchestration:**  
Orchestrate the automation your enterprise needs.
- **Self-service portal:**  
Make it easy for business users to run RPA processes.
- **Scalable robots:**  
Scale your robots up or down as workloads change.
- **Enterprise-level security:**  
Run your business processes with secure robots.

## The Challenge

To be agile and competitive, companies must continuously improve their processes. Across industries—from insurance to banking, human resources to healthcare, and telecom to e-commerce—business users are spending hours of time on mundane, repetitive, error-prone tasks that span multiple applications and back-office systems. The list of these basic tasks is long—insurance verification, loan processing, month-end reconciliation, benefits administration, medical billing, customer service fulfillment, and more. To do these tasks, employees spend enormous amounts of time logging in and out of legacy and web apps; copying and pasting data; filling out forms; opening emails and attachments; moving files and folders; and preparing, manipulating, or merging data from multiple sources. The work is inefficient and uninteresting.

## The Solution

Micro Focus RPA provides a practical, non-invasive way to build, scale, and secure automated business processes across the enterprise. Using software robots, which mimic UI-based human actions to perform everyday tasks, you can keep your underlying IT infrastructure intact. Your robots interact with apps and systems just like people do. But—they are faster, more accurate, highly secure, and never sleep. They save time. They cut costs. And they free human employees to focus on more important things.

## Micro Focus RPA Highlights

### Easy-to-Use Design Studio

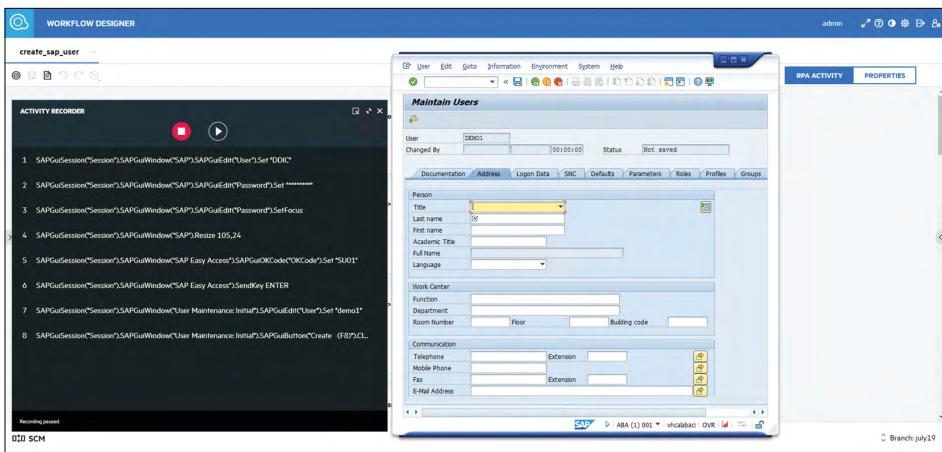

Design and edit automations with ease. The intuitive visual low-code/no-code interface makes it possible for you to do all your work in one screen. Record and edit UI actions. Parametrize inputs. Drag-and-drop, then wire-and-click UI and API automation steps. You can build sophisticated end-to-end workflows for any use case—whether simple or complex.

### Resilient Robots

Keep processes flowing when change happens. Technology-rich RPA gives your robots the power to identify more than 600 UI objects across hundreds of applications—from SAP to terminal emulation, web, and Windows. Using advanced object recognition, they record objects by their properties and can automatically adapt to changes in size, color, or position. Minor application changes won't break existing RPA workflows. You'll spend less time on maintenance as a result.

### Centralized Robot Orchestration

Orchestrate the automation your enterprise needs. Connect entire business processes by combining UI and API automation steps. Access rich out-of-the-box API content. Centrally coordinate the work of multiple robots. Apply advanced workflow logic for decision-making, parallel-processing, and error-handling. Now run, schedule, and monitor your robots from a

**Figure 1.** Do all your work in one interface—record and edit screen actions, parametrize inputs, and design automation flows.

central dashboard. Your highly capable robots are primed for enterprise action.

### Self-Service Portal

Make it easy for business users to run RPA processes. Empower them with a user-friendly interface, a searchable catalog of automation scenarios, and notifications for triggered activities. The portal is customizable—for example, you can organize processes by business function.

### Scalable Robots

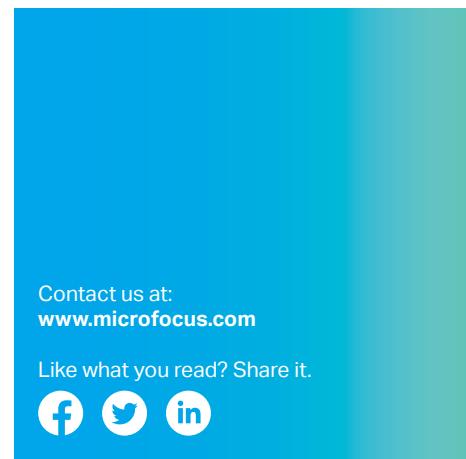

Scale your robots up or down as workloads change. A worker-queue-based architecture makes it possible to achieve load balancing and high availability. The queue manages a pool of resources and assigns robotic requests to

robots. Working 24x7, at 100 percent capacity, robots can perform massive numbers of tasks with lightning speed. Which means you can respond to demand peaks and valleys with agility.

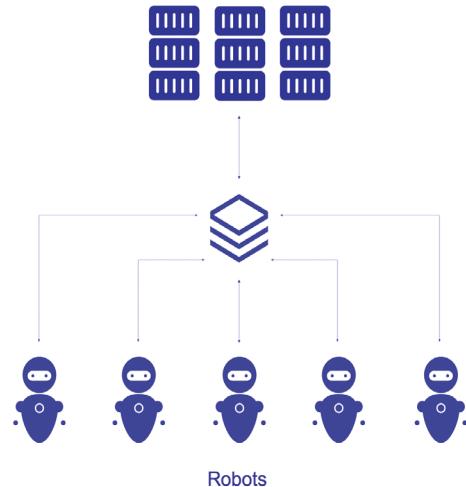

### Enterprise-Level Security

Run your business processes with secure robots. Your robots have unique IDs and role-based credentials. They can run on locked screens, use encrypted passwords, and automate processes without exposing sensitive data. Track all their actions in detailed logs, in real time. Thanks to robust error-handling capabilities, you have the flexibility to decide how to handle errors and determine robot actions.
